

Lecture 4

Cryptography

Mobile Business II (SS 2024)

Prof. Dr. Kai Rannenberg

Chair of Mobile Business & Multilateral Security
Goethe University Frankfurt a. M.

mb

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
- Application limits

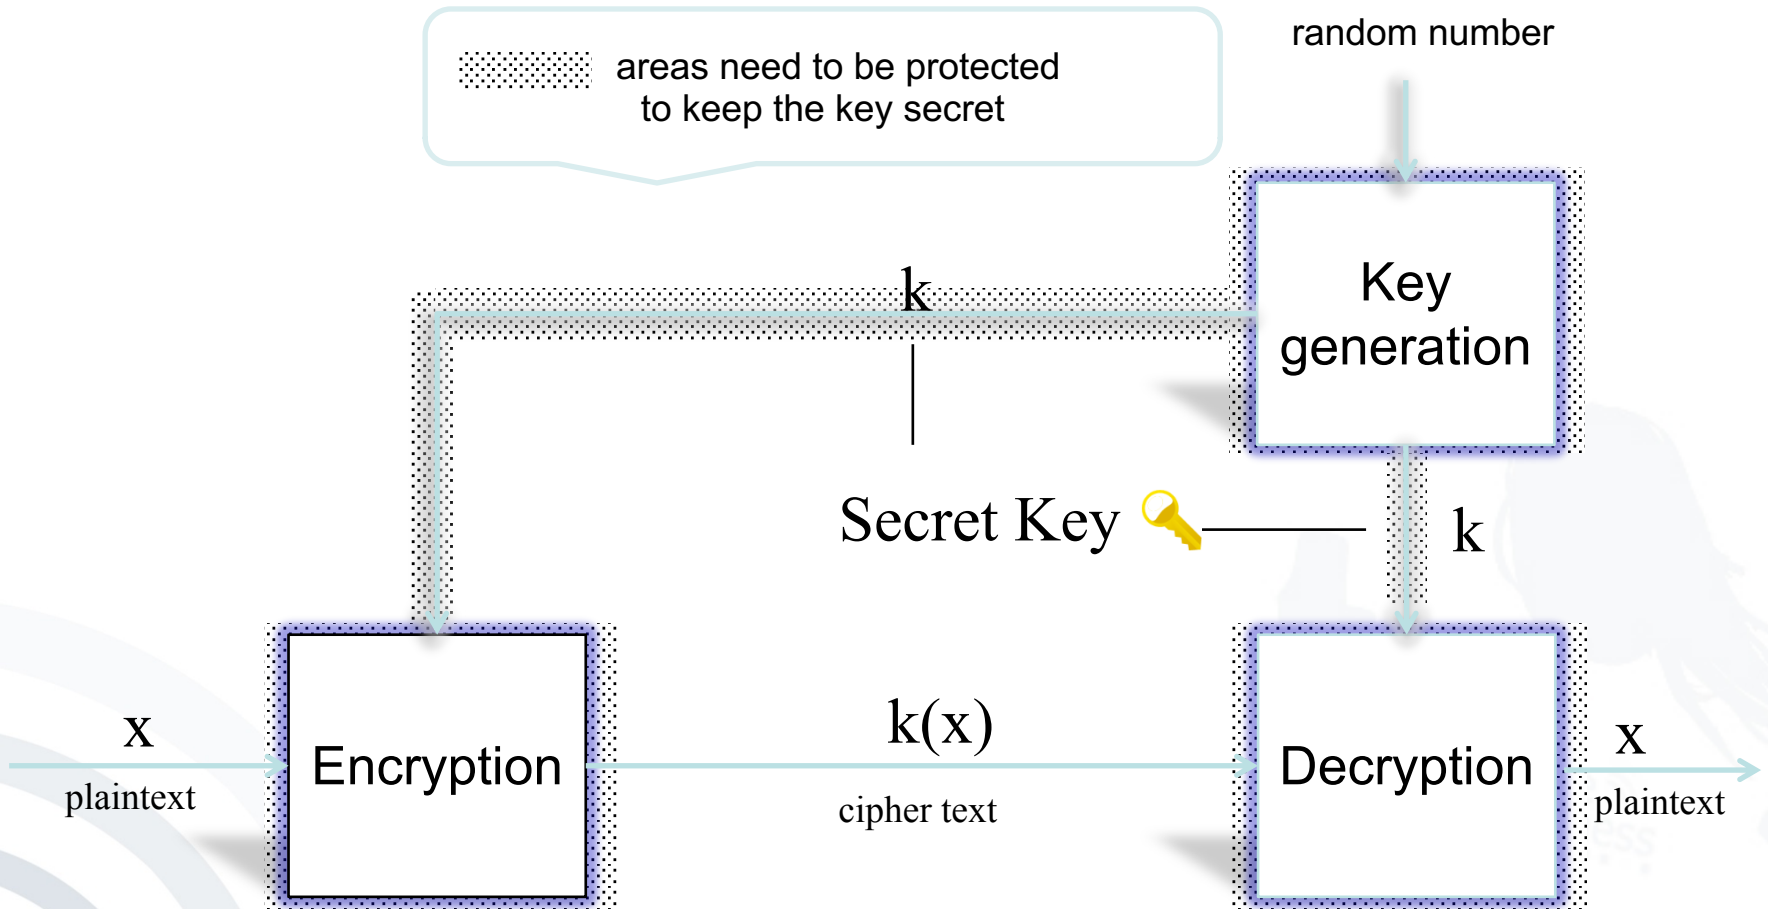

- Intention
 - Confidentiality (secrecy of messages):
encryption systems
 - Integrity (protection from undetected manipulation) and accountability:
authentication systems and **digital signature systems**
- Key distribution
 - **Symmetric:**
Both partners have the same key.
 - **Asymmetric:**
Different (but related) keys for encryption and decryption
- In practice mostly hybrid systems

- Introduction
- Symmetric Cryptosystems
 - General Concept
 - Caesar Cipher
 - AES
 - Advantages and Problems
- Public Key Cryptography
- Application limits

- Classical cryptosystems are usually based on symmetric encryption systems.
- Typical applications
 - confidential storage of user data
 - transfer of data between 2 users who negotiate a key via a secure channel
- Examples
 - Vernam-Code (one-time pad, Gilbert Vernam)
 - key length = length of the plaintext (information theoretically secure)
 - DES: Data Encryption Standard
 - key length 56 bit, so 2^{56} different keys
 - AES: Advanced Encryption Standard (Rijndael, [NIST])
 - 3 alternatives for key length: 128, 192 und 256 bit

- Introduction
- Symmetric Cryptosystems
 - General Concept
 - Caesar Cipher
 - AES
 - Advantages and Problems
- Public Key Cryptography
- Application limits

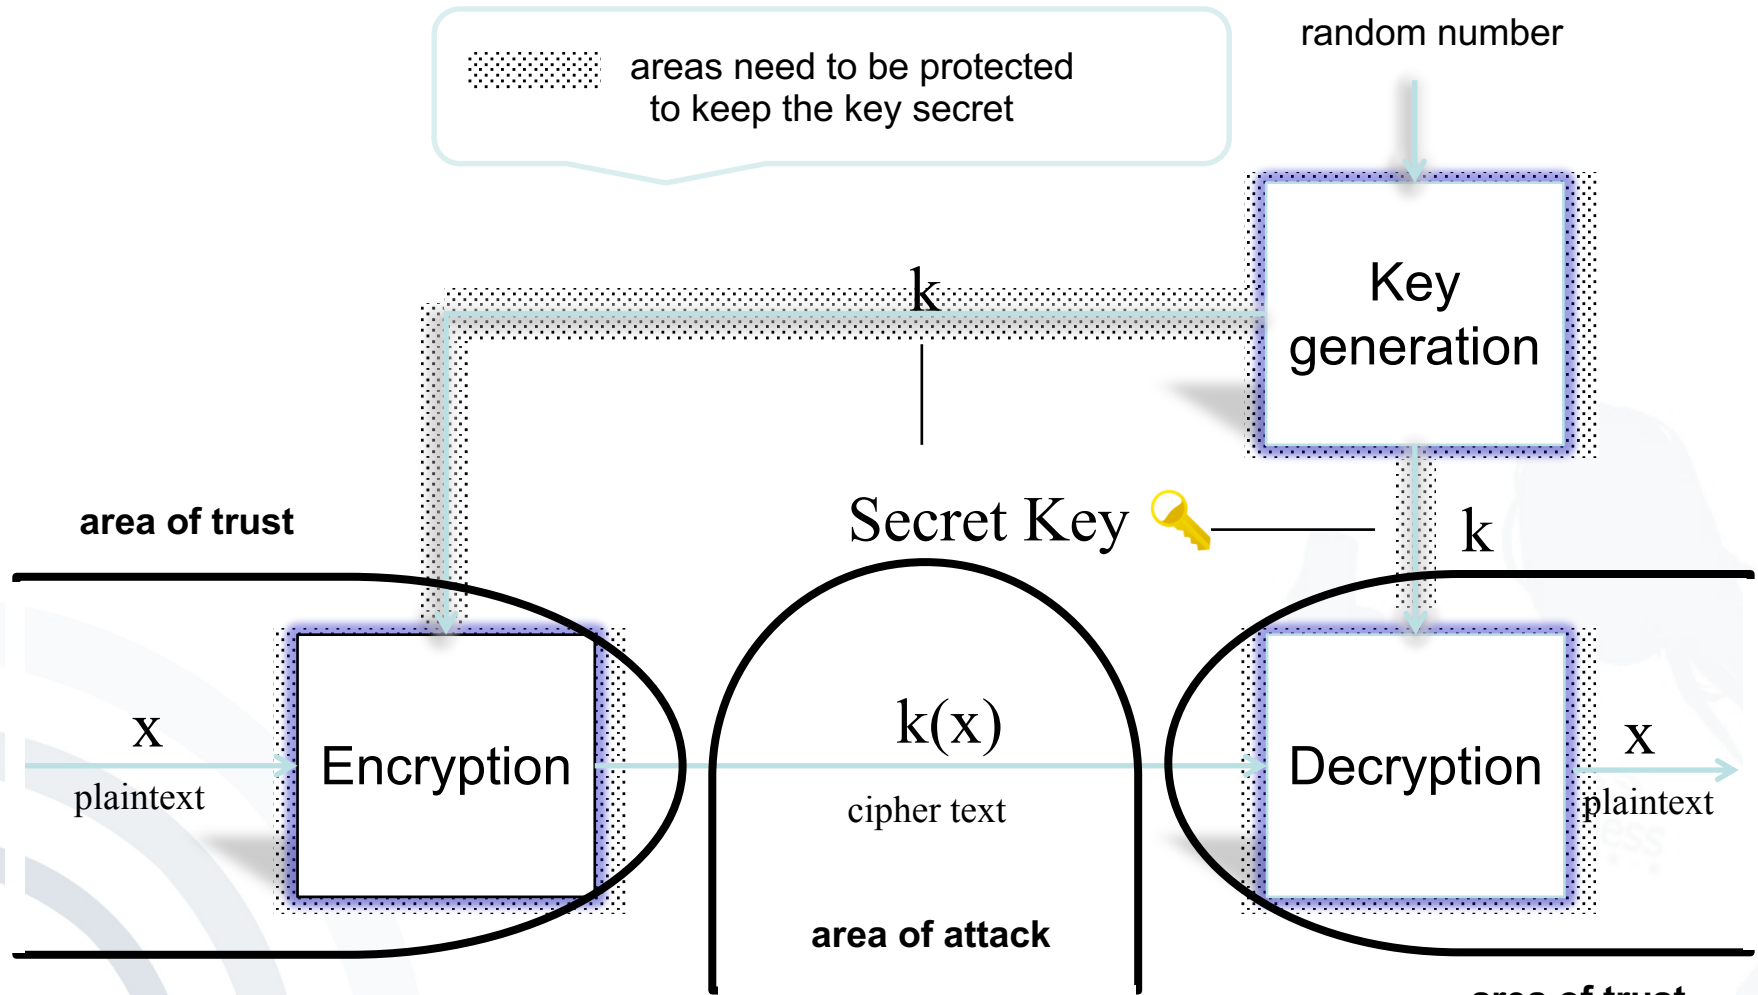

Symmetric Encryption Systems (1)

black box with lock, two equal keys

[based on Federrath and Pfitzmann 1997]

Symmetric Encryption Systems (2)

[based on Federrath and Pfitzmann 1997]

- **Keys have to be kept secret (*secret key* crypto system).**
- **It must not be possible to derive the plaintext or the used keys from the encrypted text (ideally encrypted text is not distinguishable from a numerical random sequence).**
- **Each key shall be equally probable.**
- **In principle each system with limited key length is breakable by testing all possible keys.**
- **Publication of encoding and decoding functions (algorithms) is considered as good style and is trust-building.**
- **Security of cryptosystems should base on the strength of chosen key lengths.**

- Introduction
- Symmetric Cryptosystems
 - General Concept
 - Caesar Cipher
 - AES
 - Advantages and Problems
- Public Key Cryptography
- Application limits

A	B	C	D	E	F	G	H	I	J	K	L	M
0	1	2	3	4	5	6	7	8	9	10	11	12

N	O	P	Q	R	S	T	U	V	W	X	Y	Z
13	14	15	16	17	18	19	20	21	22	23	24	25

- We assign a **number** for every **character**.
- This enables us to calculate with letters as if they were numbers.

Caesar Cipher: Example

- Very simple form of encryption.
- The encryption and decryption algorithms are very easy and fast to compute.
- It uses a very limited key space ($n=26$)
- Therefore, the encryption is very easy and fast to compromise.

- Introduction
- Symmetric Cryptosystems
 - General Concept
 - Caesar Cipher
 - AES
 - Advantages and Problems
- Public Key Cryptography
- Application limits

Advanced Encryption Standard

- The Data Encryption Standard (DES) was designed to encipher sensitive but not classified data.
- The standard has been issued in 1977.
- In 1998, a design for a computer system and software that could break any DES-enciphered message within a few days was published.
- By 1999, it was clear that the DES no longer provided the same level of security it had 10 years earlier, and the search was on for a new, stronger cipher.
- AES Rijndael was a winner of U.S. National Institute of Standards and Technology bid for advanced encryptions.
- AES has been approved for Secret or even Top Secret information by the NSA.

- Introduction
- Symmetric Cryptosystems
 - General Concept
 - Caesar Cipher
 - AES
 - Advantages and Problems
- Public Key Cryptography
- Application limits

Advantage: Algorithms are very fast

Algorithm	Performance*
RC6	78 ms
SERPENT	95 ms
IDEA	170 ms
MARS	80 ms
TWOFISH	100 ms
DES-edc	250 ms
RIJNDEAL (AES)	65 ms

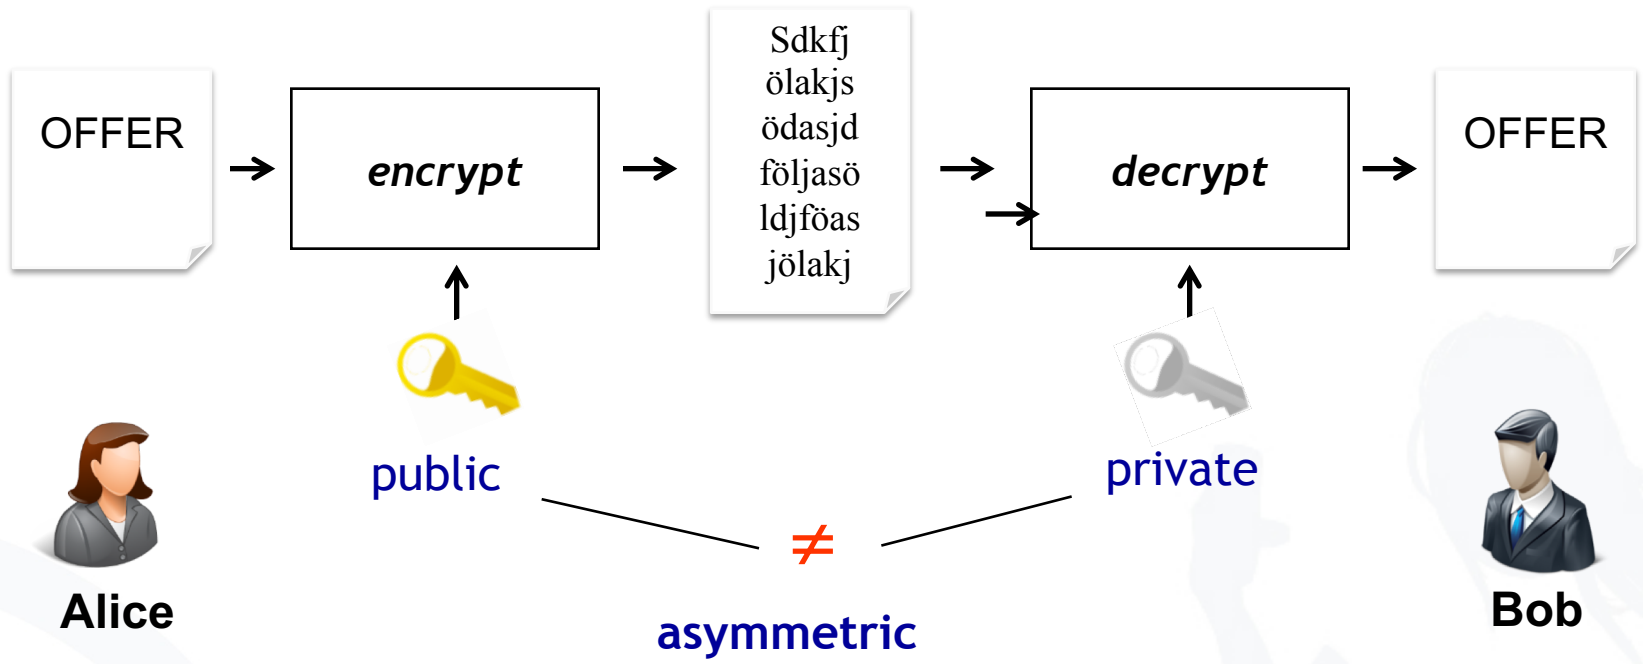

* Encryption of 1 MB on a Pentium 2.8 GHz, using the FlexiProvider Java)

Symmetric Encryption: A Possible Solution

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

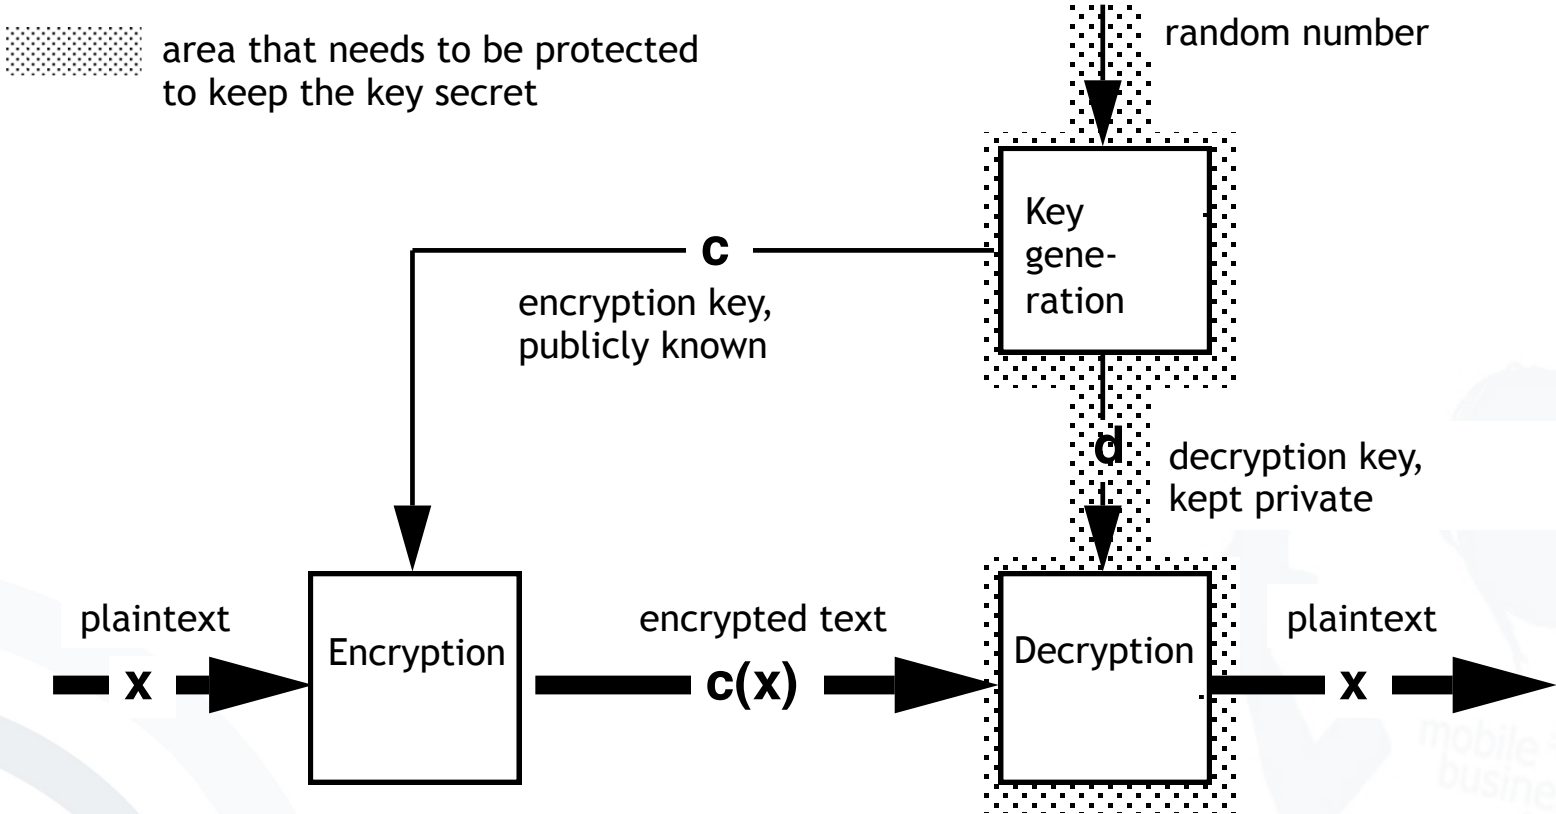

Key Exchange Problem Solved!

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

- Public key systems are based on asymmetric encryption.
- Use of ‘corresponding’ key pairs instead of one key:
 - Public key is solely for encryption.
 - Encrypted text can only be decrypted with the corresponding private (undisclosed) key.
- Deriving the private key from the public key is hard (practically impossible).
- The public key can be distributed freely, even via insecure ways (e.g. directory (*public key* crypto system)).
- Messages are encrypted via the public key of the addressee.
- Only the addressee possesses the private key for decoding (and has to manage the relation between the private and the public key).

Asymmetric Encryption Systems

box with slot, access to messages only with a key

[based on Federrath and Pfitzmann 1997]

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

- RSA

- Rivest, Shamir, Adleman, 1978
- is based on the assumption that the factorization of the product of two (big) prime numbers ($p \cdot q$) is “difficult” (product is basis for the keys)
- key lengths typically 1024 bit, today rather 2048

[Rivest et al., 1978]

- Diffie-Hellman

- Diffie, Hellman, 1976, first patented algorithm with public keys
- allows the exchange of a secret key
- is based on the “difficulty” of calculating discrete logarithms in a finite field

[Diffie, Hellman, 1976]

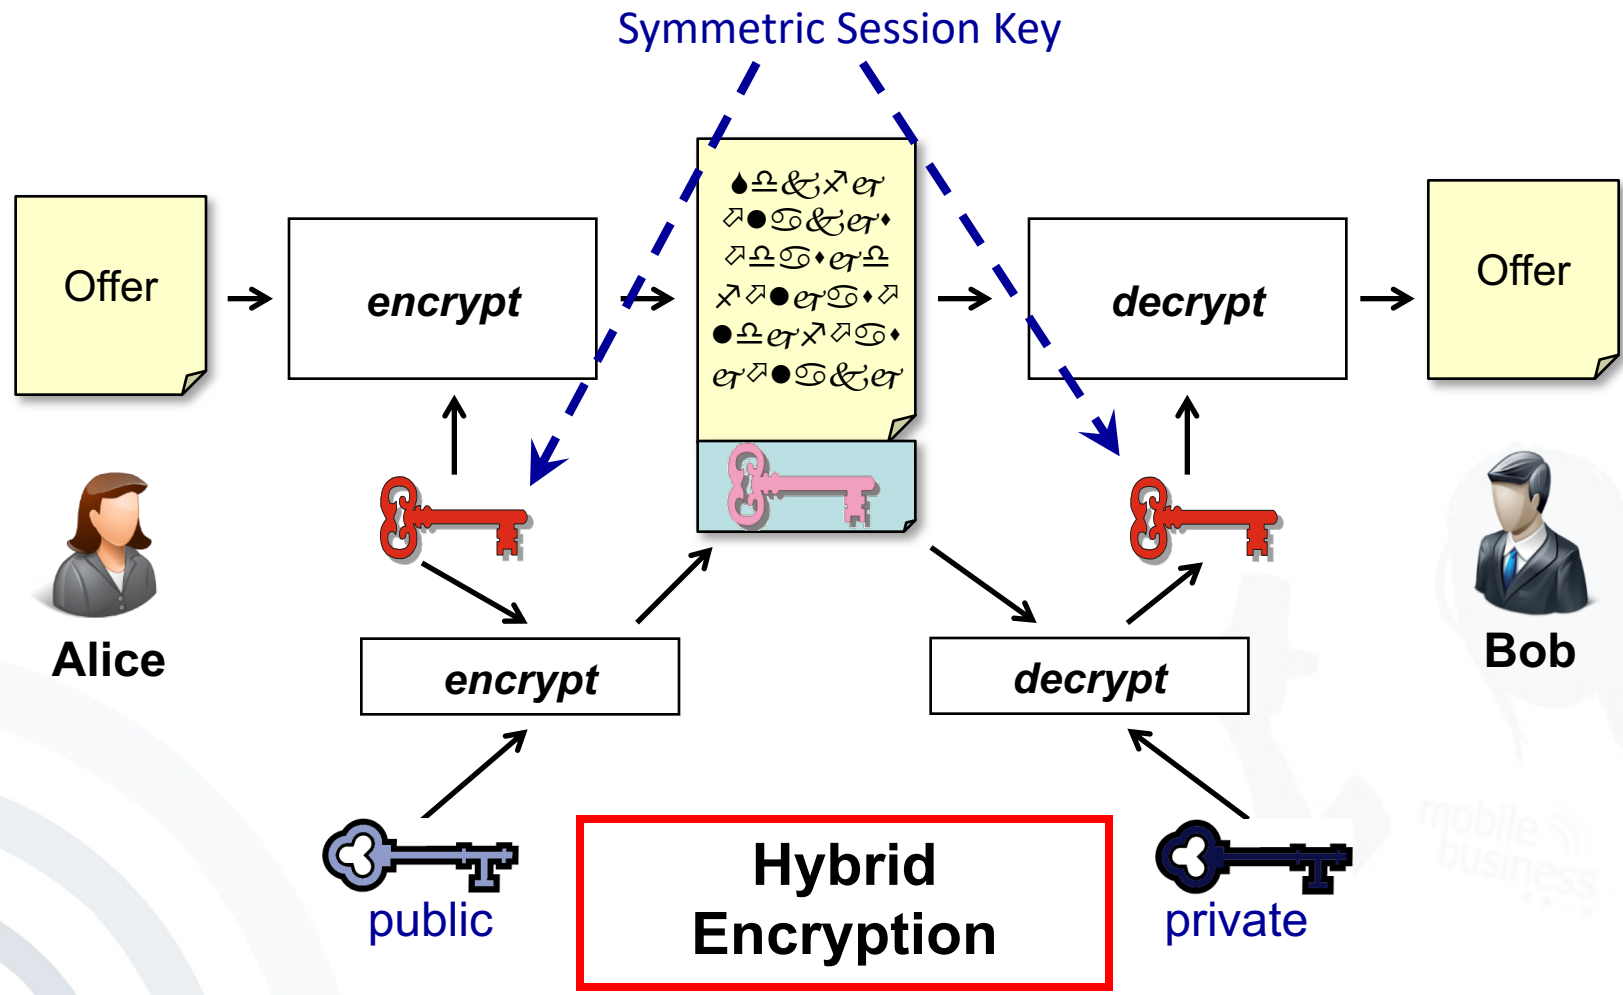

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

Algorithm	Performance*	Performance compared to Symmetric encryption (AES)
RSA (1024 bits)	6.6 s	Factor 100 slower
RSA (2048 bits)	11.8 s	Factor 180 slower

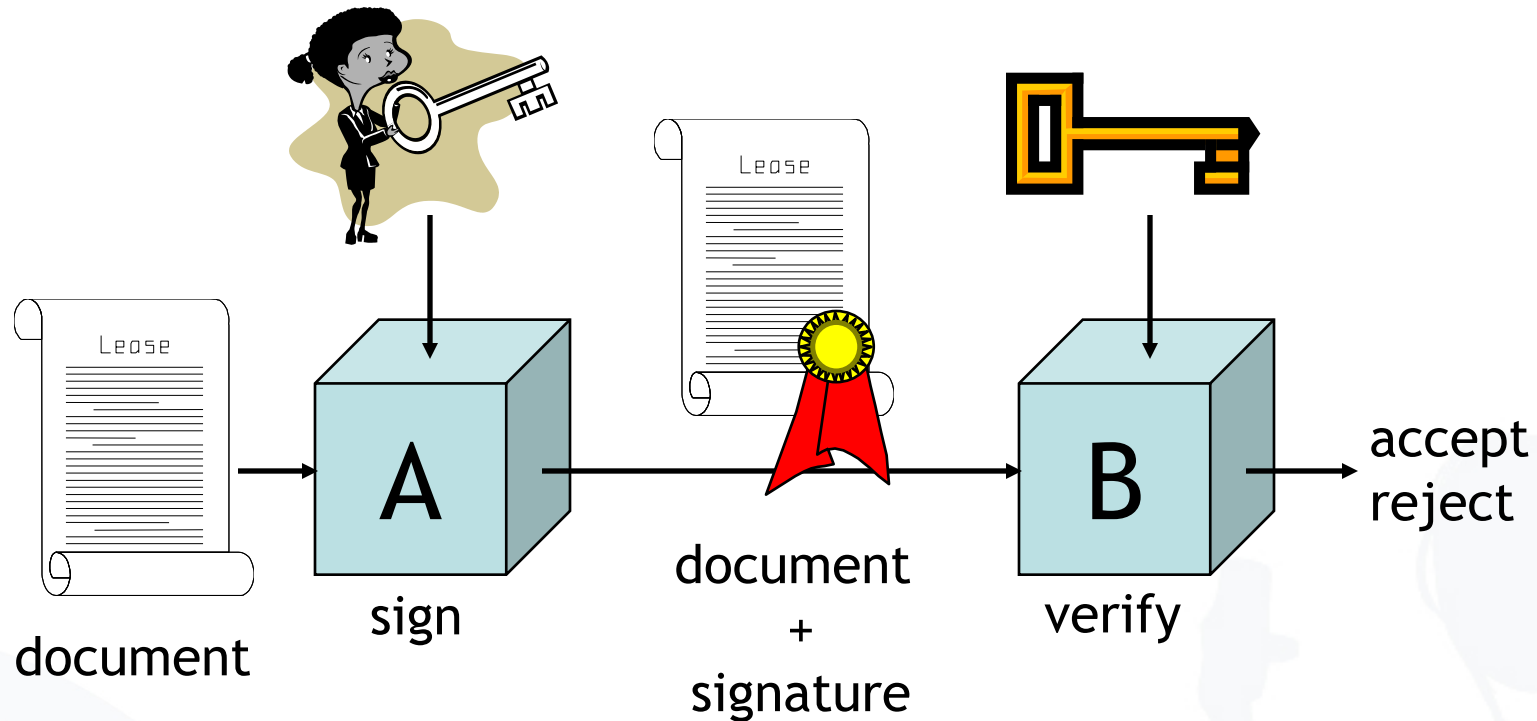

Disadvantage: Complex operations with very big numbers

⇒ Algorithms are very slow.

* Encryption of 1 MB on a Pentium 2.8 GHz, using the FlexiProvider (Java)

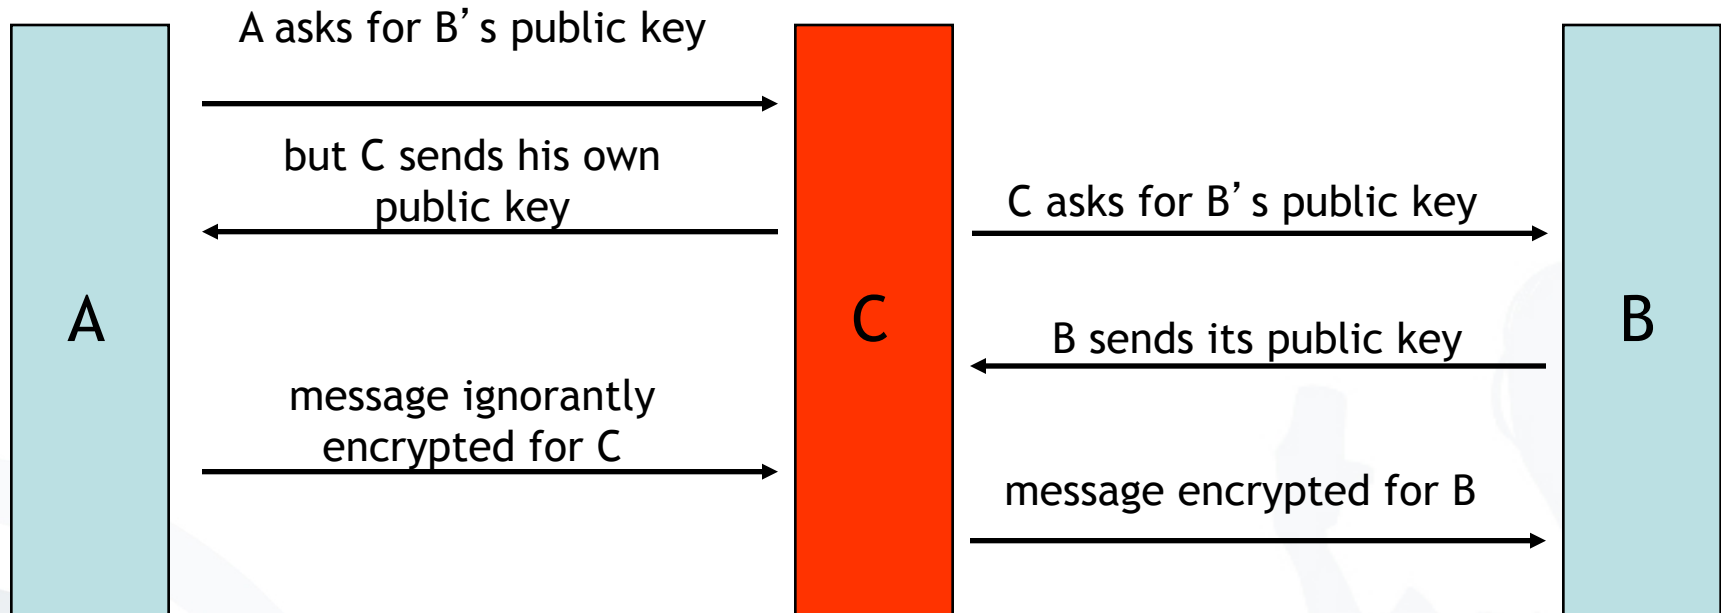

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

- ➔ Protect the authenticity and integrity of documents signed by **A**
- ➔ **B** has to get an authentic copy of **A**'s public key.

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

“Man in the middle attack”

- ⇒ Keys are certified: a 3rd person/institution confirms (with its digital signature) the affiliation of the public key to a person.

Certification of Public Keys (1)

- **B** can freely distribute his own public key.
- But: Everybody (e.g. **C**) could distribute a public key and claim that this one belongs to **B**.
- If **A** uses this key to send a message to **B**, **C** will be able to read this message!
- Thus:
How can **A** decide if a public key was really created and distributed by **B** without asking **B** directly?
 - ➔ Keys get **certified**, i.e. a third person/institution confirms with its (digital) signature the **affiliation of a public key to entity B**.
 - ➔ Public Key Infrastructures (PKIs)

Three types of organization for certification systems (PKIs?):

- Central certification authority (CA)
 - A single CA, keys often integrated in checking software
 - Example: older versions of Netscape (CA = Verisign)
- Hierarchical certification system
 - CAs which in turn are certified by “higher” CA
 - Examples: PEM, Teletrust, infrastructure according to Signature Law
- Web of Trust
 - Each owner of a key may serve as a CA
 - Users have to assess certificates on their own
 - Example: PGP (but with hierarchical overlay system)

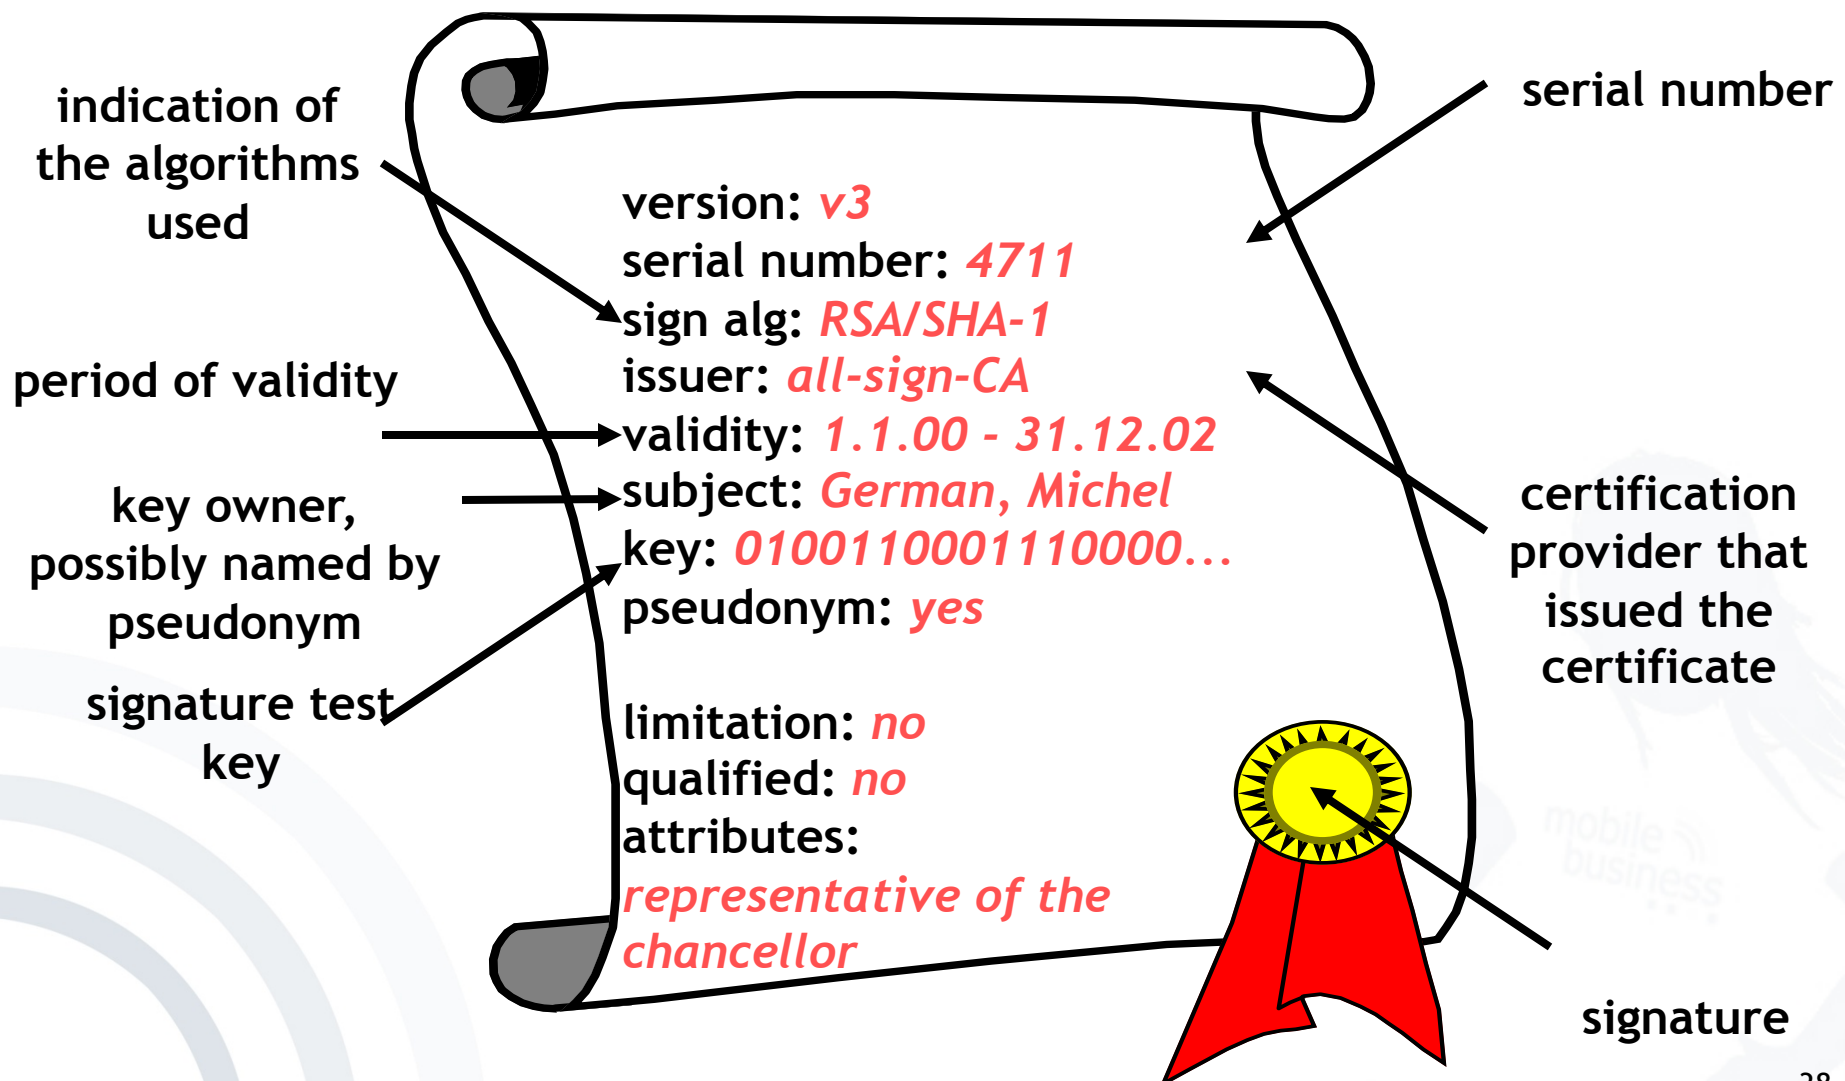

Hierarchical Certification of Public Keys

(Example: German Signature Law)

- The actual checking of the identity of the key owner takes place at so called Registration Authorities (e.g. notaries, bank branches, T-Points, ...)
- Security of the infrastructure depends on the reliability of the CAs.

Content of a Key Certificate (according to German Signature Law and Regulation)

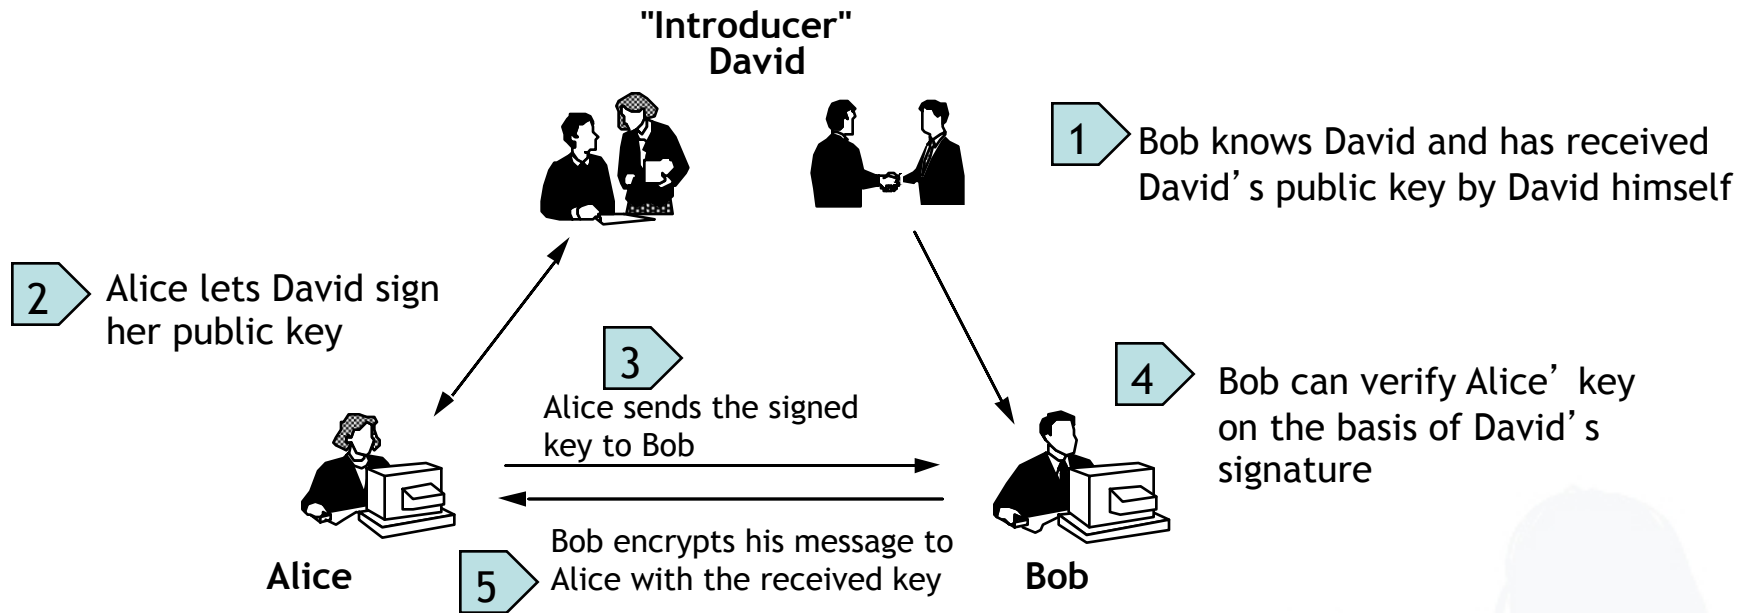

Tasks of a Certification Authority

(according to German Signature Law and Regulation)

- Reliable identification of persons who apply for a certificate
- Information on necessary methods for fraud resistant creation of a signature
- Provision for secure storage of the private key
 - at least Smartcard (protected by PIN)
- Publication of the certificate (if wanted)
- Barring of certificates
- If necessary issuing of time stamps
 - for a fraud resistant proof that an electronic document has been at hand at a specific time

- Checking of the following items by certain confirmation centers (BSI, TÜVIT, ...)
 - Concept of operational security
 - Reliability of the executives and of the employees as well as of their know-how
 - Financial power for continuous operation
 - Exclusive usage of licensed technical components according to SigG and SigV
 - Security requirements as to operating premises and their access controls
- Possibly license of the regulation authority

- Each user can act as a “CA”.
- Mapping of the social process of creation of trust.
- Keys are “certified” through several signatures.
- Expansion is possible by public key servers and (hierarchical) CAs.

Web of Trust Example

Web of Trust:

- Certification of the public keys mutually by users
- Level of the mutual trust is adjustable.

- Introduction
- Symmetric Cryptosystems
- Public Key Cryptography
 - General Concept
 - Algorithms
 - Hybrid Systems
 - Digital Signature
 - Key Management
 - Example: PGP
- Application limits

- PGP = Pretty Good Privacy
 - De facto-Standard for freely accessible e-mail encryption systems on the Internet
 - First implementation by Phil Zimmermann
 - Long trial against Phil Zimmermann because of suspicion of violation of export clauses
 - In U.S., free version in cooperation with MIT (agreement with RSA because of the patent)
 - Meanwhile commercialized: www.pgp.com
 - Gnu Privacy Guard (GPG): non-commercial Open Source variant (OpenPGP, RFC2440)

- Certification of public keys by users: “Web of Trust”
- Differentiation between ‘validity’ and ‘trust’
 - ‘Trust’ :
trust that a person / an institution signs keys only if their authenticity has really been checked
 - ‘Validity’ :
A key is valid for me if it has been signed by a person / an institution I trust (ideally by myself).
- Support through key-servers:
 - Collection of keys
 - Allocation of ‘validity’ and ‘trust’ remains task of the users
- Path server:
Finding certification paths between keys
